

Washington Flora Checklist

A checklist of the Vascular Plants of Washington State Hosted by the University of Washington Herbarium

Family: Asteraceae

467 terminal taxa (species, subspecies, and varieties).

The Washington Flora Checklist aims to be a complete list of the native and naturalized vascular plants of Washington State, with current classifications, nomenclature and synonymy.

Taxa included in the checklist:

- Native taxa whether extant, extirpated, or extinct.
- Exotic taxa that are naturalized, escaped from cultivation, or persisting wild.
- Waifs (e.g., ballast plants, escaped crop plants) and other scarcely collected exotics.
- Interspecific hybrids that are frequent or self-maintaining.
- Some unnamed taxa in the process of being described.

Family classifications follow [APG IV](#) for angiosperms, PPG I (J. Syst. Evol. 54:563-603. 2016.) for pteridophytes, and Christenhusz et al. (Phytotaxa 19:55-70. 2011.) for gymnosperms, with a few exceptions. Nomenclature and synonymy at the rank of genus and below follows the [2nd Edition of the Flora of the Pacific Northwest](#) except where superseded by new information.

Accepted names are indicated with **blue type**, synonyms with **gray type**.

Native species and infraspecies are marked with **bold-face type**.

*Non-native and introduced taxa are preceded by an asterisk.

Please note: This is a working checklist, continuously updated. Use it at your discretion.

Dicots:

Asteraceae [FNA19, HC2] Aster Family

Synonyms:

Compositae [HC]

Many taxonomic and nomenclatural changes have occurred within Asteraceae since the publication of Hitchcock and Cronquist (1973). The Flora of North America project (FNA) published the Asteraceae volumes in 2007, and that has served as the primary literature resource for the taxonomy and nomenclature provided here. Some of the introduced taxa in Washington belonging to this family are not included in the FNA volumes. Many of these can be found in Stace's New Flora of the British Isles (1997). Ken Chambers and Scott Sundberg provided a treatment of the Asteraceae for the Oregon Flora Project (OFP), and some of their taxonomic decisions are followed here rather than what is provided in FNA.

Achillea [FNA19, HC, HC2]

Sp. Pl. 2: 896. 1753; Gen. Pl. ed. 5, 382. 1754.

yarrow

Achillea millefolium L. [FNA19, HC, HC2]

Sp. Pl. 2: 899. 1753.

milfoil, yarrow

Achillea borealis Bong.

Achillea lanulosa Nutt. var. *eradiata* (Piper) M. Peck

Agoseris apargioides (Less.) Greene ssp. *maritima* (E. Sheldon) Q. Jones

Agoseris maritima E. Sheldon

Agoseris aurantiaca (Hook.) Greene [FNA19, HC, HC2]

Pittonia. 2: 177. 1891.

orange agoseris

var. aurantiaca [FNA19, HC, HC2]

orange agoseris, slender agoseris

Agoseris angustissima Greene

Agoseris arachnoidea Rydb.

Agoseris aurantiaca (Hook.) Greene ssp. *aurantiaca*

Agoseris gracilens (A. Gray) Greene

Agoseris greenei (A. Gray) Rydb.

Agoseris howellii Greene

Agoseris nana Rydb.

Agoseris prionophylla Greene

Agoseris subalpina G.N. Jones

Agoseris vulcanica Greene

FNA19:"Variety *aurantiaca* is widespread in the western cordillera and is disjunct in Quebec. Two morphologic trends occur within this variety. Plants of wetter habitats represent the typical var. *aurantiaca*; those of drier habitats resemble what past authors have called *Agoseris gracilens* (including *A. gracilens* var. *grenei*). There is a weak geographic trend to this variation, with the *aurantiaca* phase occurring mostly along the Rocky Mountains axis and the *gracilens* phase mostly along the Cascade Mountains-Sierra Nevada axis. In their extremes they appear distinct, but their intergradation is so complete that separation becomes arbitrary. Putative hybrids between var. *aurantiaca* and *A. glauca*, *A. grandiflora*, *A. monticola*, and *A. parviflora* have been collected. Corolla color in var. *aurantiaca* is variable but most commonly orange. Pink-flowered forms occur sporadically. They have been recognized as *Agoseris lackschewitzii*. Recognition of pink forms is unmerited; if it were, the older name *A. carnea* would have priority."

var. carnea P. Lesica [HC2]

Journal of Botanical Research Institute of Texas 6(1): 25-27. 2012.

pink agoseris

Agoseris lackschewitzii Douglas M. Hend. & R.K. Moseley

Agoseris xelata (Nutt.) Greene [FNA19, HC, HC2]

Pittonia. 2: 177. 1891.

tall agoseris, tall goat-chicory

Agoseris laciniata (Nutt.) Greene

Agoseris glauca (Pursh) Raf. [FNA19, HC, HC2]

Herb. Raf. 39. 1833.

pale agoseris, short-beaked agoseris

(see also *Agoseris agrestis*, *Agoseris monticola*)

var. dasycephala (Torr. & A. Gray) Jeps. [FNA19, HC, HC2]

Man. Fl. Pl. Calif. 1005. 1925.

pale agoseris, pale goat-chicory

Agoseris glauca (Pursh) Raf. var. *aspera* (Rydb.) Cronquist

FNA19: "Variety *dasycephala* occurs primarily at high elevations in the western cordillera, extending eastward onto the northern prairies, and disjunctively in the Canadian arctic (Caribou Hills). It is more readily distinguished from var. *glauca* southward, where the two varieties are $\hat{A}\pm$ elevationally separated. Difficulty in separating them occurs northward, where they are nearer each other and pockets of complete introgression occur, e.g., southeastern British Columbia and southwestern Alberta. Hybrids with *Agoseris aurantiaca* and *A. parviflora* also occur. Variety *dasycephala* contains regional phases that exhibit a step-clinal distribution. The large number of synonyms reflects the variation. As circumscribed here, var. *dasycephala* encompasses most of what has been called *Agoseris glauca* var. *agrestis* (see discussion under var. *glauca*)."

var. *glauca* [FNA19, HC, HC2]

Herb. Raf. 39. 1833.

Agoseris ~~*xagrestis*~~ Osterh. [HC2]

Agoseris lacera Greene

Agoseris lapathifolia Greene

Agoseris longissima Greene

Agoseris microdonta Greene

Agoseris procera Greene

Agoseris vicinalis Greene

FNA19: "Variety *glauca* is usually found at lower elevations from the northern prairies westward to valleys and basins of the North American cordillera. Misidentification is often due to falsely assuming this variety is strictly glabrous. Some regional phases have a high percentage of individuals with weakly puberulent peduncles and/or phyllaries. In addition, var. *glauca* intergrades with var. *dasycephala* in some locations."

Agoseris grandiflora (Nutt.) Greene [FNA19, HC, HC2]

Pittonia. 2: 178. 1891.

large-flowered agoseris

Stylopappus grandiflorus Nutt.

var. *grandiflora* [FNA19, HC2]

Pittonia. 2: 178. 1891.

large flowered agoseris, large flower goat-chicory

Agoseris cinerea Greene

Agoseris grandiflora (Nutt.) Greene var. *intermedia* (Greene) Jeps.

Agoseris grandiflora (Nutt.) Greene var. *plebeia* (Greene) G.L. Wittrock

Agoseris intermedia Greene

Agoseris marshallii (Greene) Greene

Agoseris obtusifolia (Suksd.) Rydb.

Agoseris plebeia (Greene) Greene

FNA19: "Variety *grandiflora* is most commonly found east of the Cascade Mountains and southward into California and occurs primarily in grassland, steppe, or chaparral. It has regional phases, especially southward in its range. These appear more or less distinct but they so completely intergrade that their separation becomes arbitrary. Variety *grandiflora* rarely forms intermediates with other species; putative hybrids with *A. apargioides* have been collected. It is one of the suspected parental taxa of *A. xelata*, especially the Sierra Nevada populations."

var. *leptophylla* G.I. Baird [FNA19, HC2]

Sida. 21: 267. 2004.

Puget Sound agoseris

FNA19: "Variety *leptophylla* is most commonly found west of the Cascade Mountains from Vancouver Island through the Puget Sound and Willamette Valley to the Siskiyou-Klamath Mountains region of southwestern Oregon and northwestern California. It also occurs sporadically in mesic forest areas on the eastern slopes of the Cascade Mountains, and disjunctively in the Selkirk-Clearwater Mountains region of British Columbia and northern Idaho. In the Selkirk-Clearwater Mountains region, Columbia

River Gorge, southern Willamette Valley, and Siskiyou-Klamath Mountains region var. *grandiflora* and var. *leptophylla* are sympatric and appear to be introgressive. In those regions, intermediate specimens are not uncommon. It may be one of the parental taxa of *A. xelata* (which see), especially the Puget Sound-Willamette Valley populations."

***Agoseris heterophylla* (Nutt.) Greene [FNA19, HC, HC2]**

Pittonia. 2: 178. 1891.

annual agoseris

Agoseris heterophylla (Nutt.) Greene ssp. *heterophylla*

var. *heterophylla* [FNA19, HC, HC2]

Agoseris heterophylla (Nutt.) Greene ssp. *normalis* Piper

***Agoseris monticola* Greene [FNA19, HC2]**

Pittonia. 4: 37. 1899.

mountain agoseris, Sierra Nevada agoseris

Agoseris glauca (Pursh) Raf. var. *monticola* (Greene) Q. Jones [HC]

FNA19: "*Agoseris monticola* occurs mainly in the Sierra Nevada and sporadically eastward in the Great Basin (Jarbridge and Ruby Mountains) and northward to the Cascade Range and Blue Mountains of Oregon. It appears to be allied with *A. glauca* and has been treated as a variety of the latter. Ecologically, it approaches *A. glauca* var. *dasycephala*; the two are morphologically and geographically separate from each other. Intermediates between *A. monticola* and *A. aurantiaca*, *A. glauca*, and *A. parviflora* are known."

***Agoseris retrorsa* (Benth.) Greene [FNA19, HC, HC2]**

Pittonia. 2: 178. 1891.

***Antennaria alpina* (L.) Gaertn. [FNA19, HC, HC2]**

Fruct. Sem. Pl. 2: 410. 1791.
alpine pussytoes

Antennaria alpina (L.) Gaertn. var. *canescens* Lange
Gnaphalium alpinum L.

The application of this species concept to plants in Washington warrants further consideration. . FNA19: "Excluded names: Some *Antennaria* names are based on early-generation interspecific hybrids, including: *A. xrousseaui* A. E. Porsild = ? *A. alpina* × *A. rosea* *Antennaria alpina* is one of the more morphologically variable agamic complexes in the genus. Some taxonomists have argued that true *Antennaria alpina* does not occur in North America, because none of the North American material exactly matches the type of *A. alpina*, which is from Lapland (M. O. Malte 1934; A. E. Porsild 1965). If one uses a strict typological species concept, then this is true; I recognize that this species complex is composed of innumerable apomictic clones and am circumscribing a broad species concept for *A. alpina*. The potential morphologic

overlap between the *A. media* and *A. alpina* complexes is a major taxonomic problem. The chief difference between members of the two complexes is the presence of prominent flags on cauline leaves in *A. alpina* and their absence in *A. media*. *Antennaria alpina* of North America is gynoeious and characterized by its dark green to black phyllaries and conspicuous flags on the distal cauline leaves. The basal leaves vary from glabrous, as in the type material, to pubescent. The primary progenitors of the *A. alpina* complex include *A. aromatica*, *A. densifolia*, *A. friesiana* subsp. *alaskana*, *A. friesiana* subsp. *neoalaskana*, *A. monocephala* subsp. *monocephala*, and *A. pulchella*."

***Antennaria anaphaloides* Rydb. [FNA19, HC, HC2]**

Mem. New York Bot. Gard. 1: 409. 1900.

ssp. *neodioica* (Greene) R.J. Bayer [FNA19, HC2]

Brittonia. 41: 397. 1989.
northern pussytoes

Antennaria howellii Greene ssp. *petaloidea* (Fernald) R.J. Bayer [FNA19]
Antennaria neglecta Greene var. *attenuata* (Fernald) Cronquist [HC]
Antennaria neglecta Greene var. *neodioica* (Greene) Cronquist
Antennaria pedicellata Greene

***Antennaria lanata* (Hook.) Greene [FNA19, HC, HC2]**

Pittonia. 3: 288. 1898.
woolly pussytoes

Antennaria carpathica (Wahlenb.) Hook. var. *lanata* Hook., orthographic variant

***Antennaria luzuloides* Torr. & A. Gray [FNA19, HC, HC2]**

Fl. N. Amer. 2: 430. 1843.
silvery-brown pussytoes, woodrush pussytoes

ssp. *luzuloides* [FNA19, HC2]

silvery brown pussytoes, woodrush pussytoes

Antennaria argentea Benth. ssp. *argentea*
Antennaria luzuloides Torr. & A. Gray var. *luzuloides*

***Antennaria media* Greene [FNA19, HC2]**

Pittonia. 3: 286. 1898.
alpine pussytoes, Rocky Mountain pussytoes

Antennaria alpina (L.) Gaertn. var. *media* (Greene) Jeps. [HC]

FNA19: "The main distinction between *A. media* and *A. alpina* is flags on distal cauline leaves present in *A. alpina* and mostly absent in *A. media* (Bayer 1990d). Phyllaries of the pistillate plants in *A. alpina* tend to be acute; they are blunter in *A. media*. At some point, it may be preferable to follow W. L. Jepsen ([1923?1925]) and some later authors and treat *A. media* as a subspecies of *A. alpina*. *Antennaria media* appears to be an autopolyploid derivative of *A. pulchella*; genes from *A. pulchella* may have introgressed into the *A. alpina* and *A. parvifolia* complexes indirectly through *A. media*."

***Antennaria microphylla* Rydb.**

Bull. Torrey Bot. Club. 24: 303. 1897.
little-leaf pussytoes

Antennaria microphylla Lunell var. *solstitialis* Lunell

FNA19: "*Antennaria microphylla* is a primary sexual progenitor of the *A. rosea* polyploid agamic complex (R. J. Bayer 1990b). A. Cronquist (1955) included *A. rosea* within his circumscription of *A. microphylla*. It is preferable to recognize sexual diploids as distinct from their morphologically discrete hybrid apomictic derivatives. *Antennaria microphylla* is always dioecious and has stems distally stipitate-glandular and white phyllaries; *A. rosea* is always gynoeious and has stems without glandular hairs and phyllaries only occasionally white. Some authors (A. E. Porsild 1950; E. H. Moss 1959; Porsild and W. J. Cody 1980) have recognized *A. nitida* as distinct; comparisons of the nomenclatural types of the two show that they are conspecific. *Antennaria microphylla* has allelopathic properties (G. D. Manners and D. S. Galitz 1985)."

***Antennaria monocephala* DC. [FNA19, HC2]**

Prodr. 6: 269. 1838.

Antennaria solstitialis Lunell

FNA19: "Antennaria microphylla is a primary sexual progenitor of the *A. rosea* polyploid agamic complex (R. J. Bayer 1990b). A. Cronquist (1955) included *A. rosea* within his circumscription of *A. microphylla*. It is preferable to recognize sexual diploids as distinct from their morphologically discrete hybrid apomictic derivatives. *Antennaria microphylla* is always dioecious and has stems distally stipitate-glandular and white phyllaries; *A. rosea* is always gynoeious and has stems without glandular hairs and phyllaries only occasionally white. Some authors (A. E. Porsild 1950; E. H. Moss 1959; Porsild and W. J. Cody 1980) have recognized *A. nitida* as distinct; comparisons of the nomenclatural types of the two show that they are conspecific. *Antennaria microphylla* has allelopathic properties (G. D. Manners and D. S. Galitz 1985)."

Crepis nana Richardson [FNA19, HC]

Crepis nana Richardson ssp. *nana* [HC]

Crepis nana Richardson ssp. *ramosa* Bab. [HC]

Crepis nana Richardson var. *lyratifolia* (Turcz.) Hultén

Crepis nana Richardson var. *ramosa* (Bab.) Cronquist

FNA19: "*Crepis nana* occurs in North America and northern Asia. It is recognized by the tufted, cespitose habit, elongate roots and rhizomes, and occurrence in alpine habitats. In the typical form, the plants are tufted, the stems are not leafy, and the heads are borne among the leaves. Taller specimens with elongated, leafy branches and heads borne well beyond the basal leaves are sometimes recognized as subsp. *ramosa*; these characteristics appear to be part of the normal range of variation for the species. *Crepis nana* is closely related to *C. elegans*, differing mainly in the shape of the cypselae. The cypselae of *C. nana* are almost always more columnar, wider at bases, and with broader ribs, than those of *C. elegans*."

Balsamorhiza hookeri Nutt. var. *hookeri* [HC]

Balsamorhiza hookeri Nutt. var. *lagocephala* (W.M. Sharp) Cronquist [HC]

FNA19: "At one time or another, most species of subg. *Balsamorhiza* have been synonymized under *B. hookeri*. Nevertheless, a number of taxa are justifiably segregated as species by their morphologic differences and geographic restrictions. One might logically choose either of two taxonomies: recognizing only two species in the entire genus, one representing subg. *Artorhiza* and the other subg. *Balsamorhiza*, or recognizing each slightly differing population as a species. Either course results in an unsatisfactory classification. The present classification is a compromise. A knotty problem persists. A central cluster of populations from eastern Washington to southeastern California display a number of minor and locally discrete morphologies. They tend to be less isolated from each other than are the peripheral populations, although some tend to mimic the latter ones in one or more characteristics. Their evolutionary history may be involved with past hybridizations with each other or with species of subg. *Artorhiza*, gene drift, and polyploidy. At present, it appears impossible to reach a satisfactory classification."

***Carduus tenuiflorus** Curtis [FNA19, HC, HC2]

Fl. Londin. 2(6,61): plate 55. 1789.
slender flowered thistle, winged plumeless thistle

Carduus pycnocephalus L. var. *tenuiflorus* (Curtis) Fiori

FNA 19: "Carduus tenuiflorus has been reported from New Jersey, Texas, and Washington; I have not seen specimens from those states. Carduus pycnocephalus and C. tenuiflorus are similar annuals with small, usually tightly clustered heads. The number of heads per capitulescence is usually ultimately greater in C. tenuiflorus, but early season plants of this species often have only a few heads. At the end of the growing season the fruiting heads of C. tenuiflorus are aggregated in dense, subspheric clusters. Stem wings tend to be more pronounced in C. tenuiflorus. Fresh corollas of C. pycnocephalus are rose-purple whereas those of C. tenuiflorus have a more pinkish tinge, but this difference is subtle and not reliable on herbarium material. The phyllaries of C. tenuiflorus are membranous-margined, more or less glabrate, and lack the short, stiff, upwardly appressed trichomes of C. pycnocephalus. All published chromosome counts for Carduus tenuiflorus from both Old and New World material are the same. The two species sometimes grow in mixed populations and at times appear to intergrade. Hybridization has been reported in Europe (S. W. T. Batra et al. 1981) and is suspected to occur in California. Hybrids between C. pycnocephalus and C. tenuiflorus have been designated Carduus xtheriotii Rouy."

***Carthamus** [FNA19, HC, HC2]

Cnicus [HC]

**Centaurea benedicta* (L.) L. [FNA19, HC2]

Sp. Pl. Ed. 2., 2: 1296. 1763.
blessed thistle

Cnicus benedictus L. [HC]

FNA19: "Recent molecular phylogenetic studies (A. Susanna et al. 1995; N. Garcia-Jacas et al. 2000, 2001) have begun to clarify relationships within *Centaurea* and between *Centaurea* and other genera. Some taxa traditionally included within *Centaurea* (e.g., the two native North American species, *Centaurea americana* and *C. rothrockii*) fall outside the redefined generic boundaries and are here treated in *Plectocephalus*. Others usually placed into segregate genera (e.g., *Cnicus benedictus*) are firmly nested within *Centaurea*..... Although *Cnicus* has usually been recognized as a distinctive monotypic genus, it has been merged into *Centaurea* by various authors (e.g., K. Bremer 1994; G. Wagenitz and F. H. Hellwig 1996). Recent molecular systematic studies (N. Garcia-Jacas et al. 2000) provide additional evidence that it is nested within *Centaurea*."

**Centaurea calcitrapa* L. [FNA19, HC, HC2]

Sp. Pl. 2: 917. 1753.
purple star-thistle, red star-thistle

FNA19 includes WA within the range of this species.

Centaurea debeauxii Godr. & Grenier ssp. *thuillieri* Dostál

Centaurea xmoncktonii C.E. Britton [FNA19]

Centaurea nigra L. x *Centaurea jacea* L.

Centaurea pratensis Thuill. [HC], superfluous renaming (illegitimate)

FNA19: "*Centaurea xmoncktonii* is native to Europe or originated in North America from European ancestry. Meadow knapweeds represent an array of mutually interfertile intermediates derived by hybridization and backcrossing among the various cytotypes of the *Centaurea jacea* complex. The plants variously combine features of *C. jacea* and *C. nigra*, and perhaps *C. nigrescens* as well. The hybrid complex includes both diploids and tetraploids. Extremes approach the parental types. Meadow knapweeds are often present without either parent in the immediate vicinity. They are considered to be noxious weeds in British Columbia, Idaho, Oregon, and Washington. *Centaurea pratensis* J. L. Thuillier, sometimes applied to plants that belong here, is not a legitimate name." Chambers and Sundberg (2000) treat as *C. pratensis* Thuill., which is *C. jacea* x *nigra*.

**Centaurea iberica* Trevir. ex Spreng. [FNA19, HC2]

Syst. Veg. 3: 406. 1826.
Iberian knapweed, Iberian star-thistle

FNA19: "Iberian star thistle is considered to be a noxious weed in several states of the western United States. Weed control measures in Oregon and Washington have apparently eradicated the species in those states. *Centaurea iberica* is very similar to *C. calcitrapa*, from which it differs by its pappose cypselae and often more robust habit." Chambers and Sundberg (2000) give author as Spreng. WA report is MT database Kz99, are there specimens?

Centaurea dubia Suter [HC]

Centaurea dubia Suter ssp. *nigrescens* (Willd.) Hayek

Centaurea dubia Suter ssp. *vochinensis* (Bernh. ex Rchb.) Hayek

Centaurea jacea L. ssp. *nigrescens* (Willd.) Celakovsky

Centaurea transalpina Schleich. ex DC.

Centaurea vochinensis Bernh. ex Rchb.

FNA19: Tyrol knapweed is considered to be a noxious weed in Washington and Oregon. In recent years there has been much controversy regarding the name(s) to be applied to the North American Tyrol knapweeds. The names *Centaurea vochinensis*, *C. nigrescens*, and *C. dubia* have all been used in twentieth-century North American floras, and J. T. Kartesz and C. A. Meacham (1999) have accepted *C. transalpina* as well. R. J. Moore (1972) tentatively accepted two species, *C. nigrescens* and *C. dubia*, placing *C. transalpina* and *C. vochinensis* as synonyms through application beneath both species. Moore discussed the considerable similarities and practical difficulties of differentiating the taxa. H. A. Gleason and A. Cronquist (1991) recognized *C. dubia* as including *C. nigrescens* and *C. vochinensis*. E. G. Voss (1972?1996, vol. 3) recognized *C. nigrescens* as including *C. dubia* and *C. vochinensis*. Kartesz and Meacham accept *C. nigrescens* as a species, including *C. vochinensis*; they also accept *C. transalpina* with *C. dubia* as a synonym. In our investigation of the North American Tyrol knapweeds we have not been able to distinguish more than one (admittedly variable) entity. At the species level the correct name for this taxon is *Centaurea nigrescens*. *Centaurea dubia* Suter, sometimes applied to plants that belong here, is not a valid name."

**Centaurea solstitialis* L. [FNA19, HC, HC2]

Sp. Pl. 2: 917. 1753.

yellow star-thistle

**Centaurea stoebe* L. [FNA19, HC2]

Centaurea biebersteinii DC., misapplied

Centaurea maculosa Lam. [HC], misapplied

Centaurea paniculata L., misapplied

Centaurea stoebe L. ssp. *micranthos* (S.G. Gmel. ex Gugler) Hayek [FNA19]

FNA19 includes a brief reference to this taxon in the text for *C. stoebe*. BC flora uses this interpretation, noting it is closely related to *C. paniculata*, but Chambers and Sundberg (2000) think the use of *C. bieb.* for our plants may be misapplied, and "needs further study".

**Centaurea trichocephala* M. Bieb. ex Willd. [FNA19, HC2]

Sp. Pl., ed. 4 [Willdenow] 3(3): 2286. 1803.
featherhead knapweed

FNA19: "A population of *Centaurea trichocephala* M. Bieberstein ex Willdenow (featherhead or hairy-head knapweed) was found in the late 1970s in a degraded pasture in eastern Washington (B. F. Roché and C. T. Roché 1991). A weed-control program was instituted, and the plants were successfully eradicated. Although it is apparently not established anywhere in North America, *C. trichocephala* is listed as a noxious weed in Oregon. These plants resemble *C. phrygia* in having elongate, pectinate-fringed phyllary appendages. In *C. trichocephala* the linear-filiform, featherlike appendages are much narrower than the phyllary bodies. Plants of the species spread by horizontal roots. According to Roché and Roché, *C. trichocephala* is apparently self-sterile; the Oregon plants spread clonally and formed no seeds."

**Centaurea xvarnensis* Velen. [HC2]

Fl. Bulg. 313. 1891.

hybrid diffuse knapweed, sand knapweed

(= *Centaurea diffusa* x *Centaurea stoebe* ssp. *micranthos*)

Centaurea xpsammogena G. Gáyer

This name appears at the bottom of the description for *C. diffusa*. Both the International Plant Names Index (IPNI) and TROPICOS show this name published as "*Centaurea psammogena* Gayer". IPNI indicates that the name represents a taxon of hybrid origin.

**Centromadia* [FNA21, HC2]

Fl. Francisc. 4: 424. 1897.

spikeweed

**Centromadia pungens* (Hook. & Arn.) Greene [FNA21, HC2]

dustymaidens, hoary false yarrow

Chaenactis douglasii (Hook.) H. & A var. *achilleaefolia* (H. & A.) A. Nels. [HC]

Chaenactis douglasii (Hook.) Hook. & Arn. var. *achilleifolia* (Hook. & Arn.) A. Gray

Chaenactis douglasii (Hook.) Hook. & Arn. var. *glandulosa* Cronquist [HC]

Chaenactis douglasii (Hook.) Hook. & Arn. var. *montana* M.E. Jones [HC]

Chaenactis douglasii (Hook.) Hook. & Arn. var. *rubricaulis* (Rydb.) Ferris

Chaenactis pedicularia Greene

Chaenactis ramosa Stockw. [HC]

FNA21: "Most of the diploid elements of var. douglasii are distinctive and are connected by a morphologically continuous series of polyploids (usually assigned to var. achilleifolia). Some diploid forms (including var. rubricaulis and *Chaenactis ramosa*) appear repeatedly and discontinuously in suitable habitats. In particular, forms named var. montana seem to arise wherever the species reaches sufficient elevation. Such populations have no historic or genetic cohesion to justify their recognition as a collective taxon, even though their reduced stature may become genetically fixed in each instance. (Variety alpina, recognized below with hesitation, may be just an extreme such case.) " Possibly not a syn, Kz99, BC & Chambers and Sundberg (2000) differ

Chaenactis thompsonii Cronquist [FNA21, HC, HC2]

Vasc. Pl. Pacif. N.W. 5: 123, fig. [p. 125]. 1955.

Thompson's pincushion

FNA21: "*Chaenactis thompsonii* appears to be sister to *C. evermannii*; it is known from the mountains of central and northwestern Washington. The similar habits of *C. thompsonii* and *C. ramosa* (= *C. douglasii* var. douglasii) appear to result from convergent evolution in the distinctive habitat of their type localities (Wenatchee Mountains), not from a close genetic relationship as suggested by Cronquist."

****Chondrilla*** [FNA19, HC, HC2]

Sp. Pl. 2: 796. 1753; Gen. Pl. ed. 5, 348. 1754.

gum-succory, skeletonweed

****Chondrilla juncea*** L. [FNA19, HC, HC2]

Sp. Pl. 2: 796. 1753.

hogbite, rush skeletonweed, gum succory

FNA19: "*Chondrilla juncea* is native to the Mediterranean region of Europe, North Africa, and Asia Minor. It is a weed in North America (not listed as noxious at the federal level). Its deep and extensive root system competes strongly for soil moisture and nutrients and makes control difficult because it helps the plants survive drought, cultivation, grazing, and most selective herbicides. The large, stiff branches and stems interfere with harvesting. The species is said to be "the most serious weed of Australian wheat-growing regions" (F. D. Panetta and J. Dodd 1987). It also infests millions of acres in California, Idaho, Oregon, and Washington. *Chondrilla juncea* is an obligate apomict; its seeds are formed by a parthenogenetic process (E. Battaglia 1949). Nevertheless, the species is highly variable in morphology and biochemical traits."

Cirsium remotifolium (Hook.) DC. var. *remotifolium* [FNA19]

Cirsium remotifolium (Hook.) DC. var. *rivulare* Jeps. [FNA19]

FNA19: "Variety *remotifolium* occurs primarily west of the Cascade Range in Washington and Oregon and on coastal-facing slopes in northwestern California. Intermediates with var. *odontolepis* are known through much of that range." "*Cirsium remotifolium* occurs from the Coast Ranges and valleys of the Pacific Northwest to the western slopes of the Cascade and Klamath ranges, south in the California North Coast Ranges to the San Francisco Bay region. It is closely related to the *C. clavatum* complex of the Rocky Mountains region. Both have a similar growth habit and some forms variably express the character of broadly scarious, lacerate-toothed phyllary margins. Gray, in naming *Cnicus carlinoides* var. *americanus*, included as syntypes both California and Colorado specimens. F. Petrak (1917) treated both the West Coast plants and those of the Rocky Mountains as *Cirsium* subsect. *Americana*, recognizing *C. remotifolium* with several infraspecific taxa plus two other species, *C. callilepis* and *C. amblylepis* from the West Coast, and four additional species from the Rocky Mountains. A. Cronquist (1955) rejected Petrak's subspecies, treating *C. remotifolium* in a restricted sense, limited to plants of Washington and Oregon without dilated phyllary tips, and circumscribed *C. centaureae* broadly to include the Rocky Mountains and West Coast plants with dilated phyllary tips. Because of the frequent presence of dilated phyllary tips in *C. remotifolium* in the restricted sense, Cronquist acknowledged the likelihood of past introgression with *C. centaureae* in the broad sense. J. T. Howell (1960b) recognized three species: *Cirsium remotifolium*, *C. acanthodontum*, and *C. callilepis*, the latter with four varieties collectively corresponding to the West Coast representatives of *C. centaureae* (in the sense of Cronquist). Because of the great similarity of the various West Coast plants and their intergradation, I see no value in recognizing two or more species. The West Coast and Rocky Mountains plants are clearly related, but are separated by the Great Basin region and there is little chance of current genetic interchange. As is often the case with American *Cirsium*, genetic enrichment from past hybridization with other nearby species within their respective areas has likely been fertile ground for evolutionary diversification. Different species have contributed genes in the Pacific states and in the Rockies. I have chosen to recognize two geographically-based species complexes, each with intergrading races here treated as varieties. I treat the West Coast plants as *C. remotifolium* and the Rocky Mountains plants as *C. clavatum*."

Syst. Veg. 3: 374. 1826.

wavy leaf thistle

Cirsium undulatum (Nutt.) Spreng. var. *undulatum*

FNA19: "Cirsium undulatum is widely distributed in the western half of North America from the dry plains and plateaus of the Pacific Northwest eastward across the Great Plains to Manitoba and the Dakotas and south to Texas, New Mexico, and northwestern Mexico. It occurs in scattered localities in the Rocky Mountains and northeastern Great Basin region. At least some of the few widely scattered records from the eastern United States are probably introductions. Cirsium undulatum is both widespread and variable. Plants of the Great Plains region tend to be low-growing with a few large heads and elongate corollas. Plants of the Pacific Northwest are usually taller and produce smaller, more numerous heads with shorter corollas. A detailed study of this species might reveal races worthy of recognition as infraspecific taxa. Wavyleaf thistle is listed by California as a noxious weed. However, most reports of Cirsium undulatum in California are based upon misidentifications of C. canescens. Cirsium undulatum is known to hybridize with C. flodmanii, C. hookerianum, and C. scariosum var. coloradense. J. T. Howell (1960b) reported that C. undulatum was suspected to hybridize with C. brevifolium in the Pacific Northwest."

Crepis atrabarba A. Heller ssp. *originalis* Babc. & Stebbins [HC], orthographic variant

Crepis atribarba A. Heller ssp. *attributionis*

Crepis atribarba A. Heller ssp. *originalis* (Babc. & Stebbins) Babc. & Stebbins

FNA19: "Crepis atribarba is generally recognized by the deeply pinnately lobed leaves with linear lobes, fine tomentulose indument on stems and leaves, setose phyllaries, and dark green, strongly ribbed cypselae. It is a variable mixture that includes polyploid, apomictic forms and hybrids with *C. acuminata* and other species. The typical form is recognized by its short stature, narrow pinnately lobed, tomentulose leaves, stems with 3-10 heads, and phyllaries with scattered, black, eglandular setae. Larger, more robust forms with stems 30-70 cm, 10-30+ heads, narrower involucre, and few or no black setae have been recognized as subsp. *originalis*. The latter was considered by E. B. Babcock (1947) to represent the original diploid form of the species; it is difficult to distinguish in practice."

Crepis bakeri Greene [FNA19, HC, HC2]

Crepis bakeri Greene ssp. *idahoensis* Babc. & Stebbins [FNA19, HC]

FNA19: "Crepis bakeri is generally recognized by the low stature, dense rosettes of pinnately lobed leaves with coarsely dentate lobes, tomentose stems and leaves, stipitate-glandular hairs distally on stems, relatively large involucre, and densely flowered heads. It is considered closely related to *C. occidentalis*. Three somewhat weakly defined subspecies were recognized by E. B. Babcock (1947)."

Crepis barbigera Leiberg ex Coville [FNA19, HC, HC2]

Contr. U.S. Natl. Herb. 3: 565, plate 26. 1896.
bearded hawksbeard

FNA19: "Crepis barbiger is recognized by its relatively tall stature, deeply pinnately lobed leaves, tomentulose stems, and phyllaries with coarse, green, eglandular setae. It is a complex of polyploid, apomictic forms, combining characteristics of *C. atribarba*, *C. acuminata*, and *C. modocensis*, from which the species is presumed to have been derived by intercrossing (E. B. Babcock 1947)."

***Crepis capillaris** (L.) Wallr. [FNA19, HC, HC2]

Linnaea. 14: 657. 1840.
smooth hawksbeard

Crepis capillaris (L.) Wallr. var. *capillaris*

FNA19: "Crepis capillaris is recognized by its shallow root system, dense rosettes of coarsely dentate or pinnately lobed leaves, erect slender stems, auriculate-based cauline leaves, relatively small heads, phyllaries with double rows of black setae, and fluffy white pappi. It is weedy and can become a serious lawn pest. It is one of only three species of *Crepis* with $2n = 6$; E. B. Babcock (1947) considered it to be advanced in the genus." Reports of var. *agrestis* Atkinson & Sharpe (1993) are not supported by a

specimen.

****Crepis nicaeensis*** Balbis ex Pers. [FNA19, HC, HC2]

Syn. Pl. 2: 376. 1807.

French hawksbeard, Turkish hawksbeard

FNA19: "Crepis nicaeensis is distinguished by the annual or biennial habit, shallow root system, hispid stems, and glabrate phyllaries enclosing outer cypselae. It is similar in habit to *C. biennis*, which differs in its larger heads and 13-20-ribbed cypselae; it is considered closely related to *C. capillaris* (E. B. Babcock 1947)."

Crepis occidentalis Nutt. [FNA19, HC, HC2, JPM]

J. Acad. Nat. Sci. Philadelphia. 7: 29. 1834.

western hawksbeard

Crepis occidentalis Nutt. ssp. *conjuncta* Bab. & Stebbins [FNA19, HC]

Crepis occidentalis Nutt. ssp. *costata* (A. Gray) Bab. & Stebbins [FNA19, HC]

Crepis occidentalis Nutt. ssp. *occidentalis* [FNA19, HC]

Crepis occidentalis Nutt. ssp. *pumila* (Rydb.) Bab. & Stebbins [FNA19, HC]

Crepis occidentalis Nutt. var. *costata* A. Gray

Taxonomy follows Stebbins in Jepson Manual in not recognizing subspecies in species of *Crepis* that are largely apomictic. FNA19 does recognize four subspecies. FNA19: "Crepis occidentalis is recognized by the old, brown leaf bases persisting on caudices, by stems, leaves, and phyllaries gray-tomentose, and by loose, corymbiform arrays with relatively few, relatively large heads. It is widespread and polymorphic. Some specimens have coarse setae or black, stipitate glands on the phyllaries in addition to the tomentose indument, the stipitate glands sometimes extending proximally on stems. Four intergrading subspecies were recognized by E. B. Babcock (1947). The sexual diploid forms are found in subsp. *occidentalis* and occur in northern California and adjacent Nevada. The other subspecies are polyploid and apomictic (Babcock)."

FNA20: "*Erigeron caespitosus* as recognized here is highly variable and perhaps justifiably could be divided into more than one taxon. Plants at lower elevations tend to produce tall stems branching above the middle and long, white rays. At higher elevations, especially in Idaho, western Montana, Utah, and Wyoming, stems tend to be shorter and simple and the rays commonly are blue to violet. In the Bitterroot Mountains (Ravalli and Deerlodge counties, Montana), short-stemmed, blue-rayed plants also have strigose cauline vestiture (in contrast to typically deflexed-hirtellous stems); these vestiture variants occur in the same area with plants apparently similar in all other features. Strigose populational variants also occur in Saskatchewan and Yukon, and *E. abajoensis*, largely distinguished by strigose cauline vestiture, might be considered a regional variant of *E. caespitosus*. In eastern Idaho and southwestern Montana, plants of *E. caespitosus* are commonly encountered with cauline leaves obovate and distinctly subclasping. Plants with strongly 3-nerved basal leaves occur in Carbon and Gallatin counties, Montana.

Erigeron compositus Pursh var. *discoideus* A. Gray [HC]

Erigeron compositus Pursh var. *glabratus* Macoun [HC]

Erigeron trifidus Hook. [HC2], misapplied

FNA20: "Correlations among ploidal level, breeding systems, and morphologic variation have been studied in detail in *Erigeron compositus*. Five informally designated population systems of diploids are geographically restricted (all of the northwestern United States and adjacent Canada) and primarily sexual, compared to the polyploids, which are agamospermous and apparently of hybrid origin, at least in some cases (R. D. Noyes et al. 1995; Noyes and D. E. Soltis 1996). Reduction in ray floret laminae usually is correlated with polyploidy. Plants with 1-ternately lobed leaves have been identified as var. *glabratus*, an element of variation that does not have a geographic pattern. Among closely related species, *Erigeron compositus* is the only one that produces strongly thickened caudex branches; occasional collections show a tendency toward the slender, loose branches characteristic of the other species."

showy daisy, showy fleabane, splendid fleabane

Erigeron speciosus (Lindl.) DC. var. *macranthus* (Nutt.) Cronquist [HC]

Erigeron speciosus (Lindl.) DC. var. *speciosus* [HC]

Erigeron subtrinervis Rydb. ex Porter & Britton ssp. *conspicuus* (Rydb.) Cronquist

Erigeron subtrinervis Rydb. ex Porter & Britton var. *conspicuus* (Rydb.) Cronquist [HC]

Stenactis speciosa Lindl.

Taxonomy follows Flora of North America not recognizing varieties; FNA 20 (Nesom): "Plants glabrous and glandular on the phyllaries, stems, and leaves have been recognized as var. *macranthus*; they intergrade with hairier forms and do not show a coherent geographic pattern."

Erigeron strigosus Muhl. ex Willd. [HC, HC2]

Sp. Pl., ed. 4 [Willdenow] 3(3): 1956.
branched fleabane, daisy fleabane

var. *septentrionalis* (Fernald & Wiegand) Fernald [FNA20, HC, HC2]

Rhodora. 44: 340. 1942.
prairie fleabane

Erigeron strigosus Muhl. ex Willd. ssp. *septentrionalis* (Fernald & Wiegand) Wagenitz

FNA considers this taxon to be native. FNA20: "The distributional data given here are highly provisional; the author has not attempted to sort this taxon accurately, if it can be. According to A. Cronquist (1947), var. *septentrionalis* is scattered mostly in the northern half of the continent and (1994) is "found chiefly in New England and adjacent Canada." It is "morphologically transitional" to *Erigeron annuus* (A. Cronquist 1994) and, as implied by the synonymy, may be more appropriately treated as part of *E. annuus* (D. Frey et al. 2003). As noted by Fernald in the original description, the stems may be nearly glabrous or lightly hispid, in contrast to the more densely strigose to strigillose ones of typical *E. strigosus*." Cronquist (1955, Vol 5) believes western plants called this are hybrids (*E. annuus* × *strigosus*), and var. *septentrionalis* is native in e US.

var. *strigosus* [FNA20, HC, HC2]

Sp. Pl. 3: 1956.
branching fleabane, daisy fleabane

Erigeron annuus (L.) Pers. ssp. *strigosus* (Muhl. ex Willd.) Wagenitz

FNA considers this taxon native. Introduced (in OR, Chambers and Sundberg (2000), uncertain if native in BC (Douglas et al. 1998 Reported in WA by Creso (1984)

Erigeron subtrinervis Rydb. ex Porter & Britton [FNA20, HC, HC2]

Mem. Torrey Bot. Club. 5: 328. 1894.
three-veined fleabane

FNA20: "*Erigeron subtrinervis* is variable in vestiture, perhaps reflecting gene exchange with *E. speciosus*. *Erigeron speciosus* var. *mollis* (A. Gray) S. L. Welsh may be a recurrent hybrid; it is identified here within *E. subtrinervis*."

Grindelia integrifolia DC. [FNA20, HC, HC2]

Prodr. 5: 315. 1836.

Puget Sound gumweed, Willamette Valley gumweed

(see also *Grindelia hirsutula*)

Grindelia integrifolia DC. var. *integrifolia* [HC]

FNA20: "But for the stipitate-glandular apices of the phyllaries, plants of *Grindelia integrifolia* are very much like some plants treated here in *G. hirsutula*. Taxonomic status for plants that have been called *G. integrifolia* should be reconsidered."

Grindelia nana Nutt. [JPM2, OFP]

Trans. Amer. Philos. Soc. ser. 2, 7: 314. 1840.

Idaho gumweed, low gumweed

Grindelia nana Nutt. ssp. *nana*

var. discoidea (Nutt.) A. Gray [OFP]

Syn. Fl. N. Amer. 1(2): 119. 1884.

Columbia gumweed, rayless gumweed

Grindelia columbiana (Piper) Rydb. [HC]

Grindelia nana Nutt. ssp. *columbiana* Piper

Endemic to the Columbia River Gorge in Washington and Oregon.

var. *nana* [Revised HC2, Flora of Oregon]

low gumweed

Grindelia hirsutula Hook. & Arn. [FNA, HC2, OFP, JPM2], misapplied

Grindelia squarrosa (Pursh) Dunal [FNA20, HC, HC2]

Mém. Mus. Hist. Nat. 5: 50. 1819.

curlycup gumweed, serrate resinweed

(see also *Grindelia hirsutula*)

Grindelia squarrosa (Pursh) Dunal var. *squarrosa* [HC]

Oregon Flora Project: "Although *G. squarrosa* is similar to *G. nana* in the form of its inflorescence and can sometimes be difficult to distinguish, the two species are rather distantly related and are unlikely to hybridize. *Grindelia squarrosa* appears to be increasing throughout its range and taking over areas that were occupied until recently by *G. nana* (and other species in other states)."

var. *serrulata* (Rydb.) Steyerm. [OFP]

curlycup gumweed, serrate resinweed

(see also *Grindelia hirsutula*)

Oregon Flora Project: "Although *G. squarrosa* is similar to *G. nana* in the form of its inflorescence and can sometimes be difficult to distinguish, the two species are rather distantly related and are unlikely to hybridize. *Grindelia squarrosa* appears to be increasing throughout its range and taking over areas that were occupied until recently by *G. nana* (and other species in other states)."

Grindelia stricta DC. [JPM2, OFP]

Prodr. [A. P. de Candolle] 7(1): 278. 1838.

Oregon gumweed

Grindelia integrifolia DC. [HC2, JPM2, OFP], misapplied

Grindelia hirsutula is misapplied in Washington. Coastal specimens of this species are referential to *G. stricta* and *G. integrifolia*, and interior specimens are referential to *G. nana*.

var. *stricta* [JPM2, OFP]

Grindelia stricta DC. ssp. *stricta*

Grindelia hirsutula is misapplied in Washington. Coastal specimens of this species are referential to *G. integrifolia*, and interior specimens are referential to *G. nana*.

Chrysopsis villosa (Pursh) Nutt. ex DC. var. *foliosa* (Nutt.) Cronquist [HC]

Chrysopsis villosa (Pursh) Nutt. ex DC. var. *foliosa* (Nutt.) D.C. Eaton, orthographic variant

Voucher? OR reports in Peck (1961) misapplied (Chambers and Sundberg 2000). FNA20: "Variety *foliosa* is most common at the base of the Front Range in Colorado and Wyoming; it occurs scattered across the northern part of its range in the mountains and western prairies. Plants that are glandular but otherwise like var. *foliosa* are presumed here to be hybrids with either var. *minor* or var. *nana*. Variety *foliosa* is most similar to var. *ballardii*."

var. *minor* (Hook.) Semple [FNA20, HC2]

Novon. 4: 54. 1994.
hairy goldenaster, hispid goldenaster

Chrysopsis villosa (Pursh) Nutt. ex DC. var. *hispidula* (Hook.) A. Gray [HC]

Heterotheca villosa (Pursh) Shinnery var. *hispidula* (Hook.) V.L. Harms

FNA20: "Variety *minor* is distinguished by its usually narrowly to broadly oblanceolate distal cauline leaves (sometime oblong or ovate) and moderately glandular and hispid-strigose indument. The leaf bases are usually narrowly to broadly cuneate or attenuate (rarely rounded). Distal leaf faces usually have about 10?50 hairs/mm² and about 4?20 glands/mm². The variety is the most variable in the species and includes some local distinctive morphotypes that grade into other forms. Plants intermediate between this and all other varieties occur in areas where the ranges are sympatric, and

they make infraspecific taxonomy of the species difficult. The variety has been incorrectly referred to as var. *hispidula* (a later synonym) in most floras. The status of *Heterotheca barbata* (Rydberg) Semple (*Chrysopsis barbata* Rydberg), the Spokane goldenaster, is uncertain. J. C. Semple (1996) treated it as a separate species to draw attention to the problem; a detailed description based on the type and detailed illustrations were included. It is known from the type collection along the Spokane River Valley east of Spokane, Idaho, and two down-river, atypical collections (Benton and Spokane counties, Washington). It flowers in July (sometimes August). It is similar to *H. villosa* var. *minor*, but differs in having lanceolate-elliptic distal cauline leaves (34?38 × 8?9 mm) that are little reduced distally, long branches (each with one to a few large heads), and disc corollas with a few, very long hairs on the tube. Further work is needed to increase the number of specimens available for a detailed comparison with *H. villosa* var. *minor* in order to clarify whether *H. barbata* warrants species level recognition, should be included in *H. villosa* as a variety, or placed in synonymy under var. *minor*."

var. *villosa* [FNA20, HC2]

Field & Lab. 19: 71. 1951.

common nipplewort

FNA19: "*Lapsana communis* is widely distributed in North America. It is easily recognized by the abruptly constricted lyrate leaves with relatively large terminal lobes, heads of relatively small flowers with yellow corollas, keeled phyllaries, and epappose cypselae. It is aggressively weedy and often found in shady disturbed sites. The milky juice of *L. communis* is said to be soothing to sensitive skin, particularly on the nipples of nursing mothers."

wild chamomile, scented mayweed

Matricaria recutita L.

FNA19: "Although the name *Matricaria chamomilla* has been considered to be misapplied (e.g., S. Rauschert 1974; A. Cronquist 1994; E. G. Voss 1972?1996, vol. 3), W. L. Applequist (2002) argued convincingly that the name is indeed correctly applied to the taxon described here. Among the North American material, specimens with coronate ray cypselae (var. *chamomilla*), or wholly without coronas [var. *recutita* (Linnaeus) Grierson] have been encountered but none with fully coronate cypselae (var. *coronata* J. Gay ex Boissier), even though synonymy under this name includes *M. courrantiana*, reported for Texas and New Mexico (specimens not seen). The varieties may not be worth recognizing (Applequist; Q. O. N. Kay 1976) and are not treated formally here." Rauschert (1974) transferred this from *Matricaria* to *Chamomilla*

***Matricaria discoidea* DC. [FNA19, HC2]**

Prodr. 6: 50. 1838.

pineapple weed

Chamomilla discoidea (DC.) J. Gay ex A. Braun

Chamomilla suaveolens (Pursh) Rydb.

Matricaria matricarioides (Less.) Porter [HC], illegitimate name

Santolina suaveolens Pursh

FNA19: "*Matricaria discoidea* has been used as a medicinal and aromatic plant by Native American tribes (D. E. Moerman 1998). It also is considered a weed, and it is resistant to a photosystem II inhibitor herbicide in the United Kingdom (www.weedscience.org). It is a northwestern North American native that has spread to eastern and northern North America and elsewhere (E. McClintock 1993b; E. G. Voss 1972?1996, vol. 3; A. Cronquist 1994). NatureServe (www.natureserve.org) and Natural Resources Conservation Service (plants.usda.gov) erroneously present *M. discoidea* as introduced on the continent. Its natural habitat is ill-defined because the species has become ruderal even in its native range. For discussion of the nomenclature of this taxon, see S. Rauschert (1974); K. N. Gandhi and R. D. Thomas (1991); Cronquist; and Voss. *Matricaria matricarioides* (Lessing) Porter cannot be applied to the American taxon; *M. matricarioides* was originally published as *Artemisia matricarioides* Lessing, a new name for *Tanacetum pauciflorum* Richardson (see S. Rauschert 1974), itself a synonym of *T. huronense* Nuttall. W. Greuter (pers. comm.), who accepts *M. discoidea*, considers Rauschert's treating *Artemisia matricarioides* as homotypic with *T. pauciflorum* as equivalent to a lectotype designation."

arrowhead sweet coltsfoot, arrowleaf coltsfoot

Petasites sagittatus (Pursh) A. Gray [HC]

The taxonomy of this complex, including *Petasites frigidus* and *P. sagittatus*, is disputed. Cherniawsky and Bayer (1998a,b,c) have shown the group has diverged only recently, and proposed a series of varieties with broadly overlapping ranges. We prefer the classification of H&C and JPM, and maintain *P. sagittatus* as a full species.

var. *xvitifolius* (Greene) Cherniawsky & R.J. Bayer [FNA20, HC2, KZ99]

Canad. J. Bot. 76: 2072. 1999.

hybrid coltsfoot, Wenatchee coltsfoot

Petasites nivalis Greene ssp. *vitifolius* (Greene) J. Toman

Petasites trigonophyllus Greene

Petasites xvitifolius Greene [HC]

Petasites warrenii H. St. John

FNA20: "Petasites frigidus var. xvitifolius often grows in association with one or both putative parents (P. frigidus var. palmatus and P. frigidus var. sagittatus)." Bogle (1961, 1968) produced this hybrid through artificial crosses.

dwarf woollyheads

Psilocarphus globiferus Nutt.

FNA19: "Variety *brevissimus* occupies nearly the full range of the genus (uncommon west of the Cascade Range); some occurrences toward the northeast appear to be recent introductions."

***Psilocarphus elatior* (A. Gray) A. Gray [FNA19, HC, HC2]**

Syn. Fl. N. Amer. ed. 2. 1: 448. 1886.
tall woollyheads

Psilocarphus oregonus Nutt. var. *elatior* A. Gray

perhaps best treated as a geographic subspecies of *P. brevissimus* (Chambers and Sundberg 2000). FNA19: "*Psilocarphus elatior* occurs west of the Cascade Range from California to Vancouver Island, British Columbia, and in scattered areas eastward (northwestern Montana, mountains surrounding the border area common to Oregon, Washington, and Idaho). Reports of *P. elatior* from Alberta and Saskatchewan were based on relatively erect forms of *P. brevissimus* var. *brevissimus*. *Psilocarphus elatior* has been of conservation concern in Canada (J. M. Illingworth and G. W. Douglas 1994). Where sympatric, *Psilocarphus elatior* tends to inhabit relatively dry or seasonally flooded sites in more mesic coastal or montane climates and *P. brevissimus* var. *brevissimus* occurs mainly in wetter, seasonally inundated sites in semiarid climates. Some specimens appear to be intermediate; further study may show the two taxa to be better treated as varetially distinct. See also under *P. brevissimus* var. *multiflorus*."

***Psilocarphus oregonus* Nutt. [FNA19, HC, HC2]**

Trans. Amer. Philos. Soc., n. s. 7: 341. 1840.
Oregon woollyheads

FNA19: "*Psilocarphus oregonus* occurs from west-central California through most of Oregon to southeastern Washington, western Idaho, and northern Nevada. Relatively narrow-leaved, montane forms of *P. tenellus* account for reports of *P. oregonus* from the southern Sierra Nevada to Baja California; further study may show these to be intermediates between the two taxa."

Senecio foetidus Howell var. *foetidus* [HC]

Senecio foetidus Howell var. *hydrophiloides* (Rydb.) T.M. Barkley ex Cronquist [HC]

Senecio oreganus Howell

FNA20: "Plants of *Senecio hydrophiloides* from toward the western end of the range tend to have the heads more or less congested and eradiate and stems loosely clustered; plants from toward the eastern edge tend to have heads loosely arrayed and radiate and stems single. The two forms have been recognized as weakly defined species (or varieties), the former as *Senecio foetidus* and the latter as *S. hydrophiloides*. They intergrade so completely that they are best treated as a single, variable taxon. The use of the epithet *foetidus* for the broadly conceived single species was based on a bibliographic misunderstanding; the correct epithet is *hydrophiloides* (T. M. Barkley 1978; A. Cronquist 1994). In 1900, Thomas Howell gave the name *Senecio oreganus* to a collection from Lake Labish, near Salem, Oregon. The area has seen much disturbance and development since Howell's time, and the plant appears to be extinct in the region. The collection is difficult to exclude from *S. hydrophiloides*, and the collection is here regarded as an odd outlier of *S. hydrophiloides*, which is known chiefly from east of the Cascade uplift. Howell's collection and therefore the name *S. oreganus* also have been treated within *S. sphaerocephalus* (T. M. Barkley 1978; A. Cronquist 1955); that attribution appears to be in error. The "type" materials are now in the herbarium of Oregon State University in Corvallis."

Canada goldenrod, meadow goldenrod, Rocky Mountains Canada goldenrod

Solidago canadensis L. ssp. *salebrosa* (Piper) D.D. Keck

Solidago canadensis L. var. *salebrosa* (Piper) M.E. Jones [HC]

Solidago gigantea Aiton [FNA20, HC, HC2], misapplied

FNA20: "Variety *salebrosa* strongly resembles *Solidago canadensis*, and is found throughout most of the Rocky Mountains in the United States and adjacent Canada. It has been included in *S. canadensis* by many authors (e.g., A. Cronquist 1994). In extreme forms the array is broader than tall with long, arching proximal branches. Hairier plants can be similar in appearance to *S. altissima*; the latter is usually not glandular and is much hairier. Glabrate plants of var. *salebrosa* can be difficult to distinguish from hexaploid *S. gigantea* near and in the mountains from Alberta south to New Mexico. Glabrate plants in the mountains often treated as *S. gigantea* are glandular and belong in *S. lepida* var. *salebrosa*. Small-headed diploids found in the Rocky Mountains from southern British Columbia to Colorado are usually sparsely glandular and could be confused with short-array forms of *S. elongata*." Check WTU colls for specimens of *S. altissima*, reported N to BC by Semple (1993)

***Solidago missouriensis* Nutt. [FNA20, HC, HC2]**

J. Acad. Nat. Sci. Philadelphia. 7: 32. 1834.

Missouri goldenrod

Solidago missouriensis Nutt. var. *extraria* A. Gray [HC]

Solidago missouriensis Nutt. var. *fasciculata* Holz. [HC]

Solidago missouriensis Nutt. var. *missouriensis* [HC]

Solidago missouriensis Nutt. var. *tolmieana* (A. Gray) Cronquist [HC]

FNA20: "*Solidago missouriensis* was often introduced along railroad lines farther east. It is a highly variable species. In the east, it can be similar to *S. juncea* and is not always easily distinguished where ranges overlap. In the west, it can be similar to smaller plants of *S. spectabilis*. It is distinguished from the related species by its usually 3-nerved proximal leaves and the usually thin, elongate rhizomes. Across the prairies the species is known to be diploid only ($2n = 18$). In the Rocky Mountains, tetraploids ($2n = 36$) are

common, the diploids infrequent. A number of varieties have been described. Shorter, often larger-headed plants (tetraploids when known) from the Rocky Mountains have been treated as var. *missouriensis* (including var. *extraria*). Taller, more leafy-stemmed plants, mostly from the eastern half of the range, but occasionally west to Washington, have been treated as var. *fasciculata*. Plants from Arizona, Colorado, and New Mexico with long, linear leaves have been treated as var. *tenuissima*. Larger-headed plants with narrow bracts from prairies west of the Cascades in Oregon and Washington have been treated as var. *tolmieana*. A. Cronquist (1994) opted not to recognize varieties, noting that all appeared to grade continuously into each other. A detailed study of the species is needed."

***Solidago multiradiata* Aiton [FNA20, HC, HC2]**

Hort. Kew. 3: 218. 1789.

northern goldenrod, Rocky Mountain goldenrod

Solidago multiradiata Aiton ssp. *scopulorum* (A. Gray) W.A. Weber

Solidago multiradiata Aiton var. *scopulorum* A. Gray [HC]

FNA20: "Solidago multiradiata is the North American species most closely related to *S. virgaurea*, the type species of the genus, native to mostly arctic and alpine regions of Eurasia. Plants of *S. multiradiata* from the Rocky Mountains have been treated as var. *scopulorum*; they differ so little from those of other parts of the range that recognition of the variety without further support does not appear justified."

Taraxacum officinale F.H. Wigg. ssp. *ceratophorum* (Ledeb.) Schinz ex Thell.

Taraxacum paucisquamosum M. Peck

Taraxacum sibiricum Dahlst.

FNA19: "Taraxacum ceratophorum is the most widespread native dandelion in North America, ranging from the low Arctic and boreal zone to the western Cordilleras, in the montane and alpine zones. This complex has been subdivided into many microspecies in North America, most of which appear unworthy of

recognition." See Douglas et al. (1998) for review of taxonomic treatments, complicated by apomixis, polyploidy, and hybridization

**Taraxacum erythrospermum* Andr. ex Besser [FNA19, HC2]

Enum. Pl. 75. 1822.
red-seeded dandelion

Taraxacum laevigatum (Willd.) DC. [HC]

Taraxacum laevigatum (Willd.) DC. var. *erythrospermum* (Andr. ex Besser) J. Weiss

Taraxacum officinale F.H. Wigg. var. *erythrospermum* (Andr. ex Besser) Bab.

Taraxacum scanicum Dahlst.

FNA19: "Early leaves of *Taraxacum erythrospermum* sometimes may be broadly winged along the midvein, making distinction from *T. officinale* difficult; usually, its later leaves become more deeply lobed with time. The name *Taraxacum laevigatum* has been used for *L. erythrospermum* in North America, following H. Handel-Mazzetti (1907). L. H. Shinnors (1949) questioned that usage. The name is listed in the index of *Flora Europaea* (A. J. Richards and P. D. Sell 1973) as an unassigned synonym; it could be related to three different entities of sect. *Spectabilia*. And, it is not mentioned by other modern students of the group. Therefore, (1) given that the North American entity has not been identified with a particular Eurasian taxon; (2) to avoid using a microspecies name such as *T. scanicum*; and (3) despite the lack of typification of the name, I am using *T. erythrospermum* as a place holder until nomenclatural issues are resolved. This clearly associates the taxon with the section to which it belongs."

**Taraxacum officinale* F.H. Wigg. [FNA19, HC, HC2]

Prim. Fl. Holsat. 56. 1780.
common dandelion

Taraxacum officinale F.H. Wigg. ssp. *vulgare* (Lam.) Schinz & R. Keller

FNA19: " *Taraxacum officinale* is the most widespread dandelion in temperate North America, though its abundance decreases in the arid south. It is a familiar weed of lawns and roadsides. It is also the species most commonly used for medicinal and culinary purposes (e.g., E. Small and P. M. Catling 1999).

Phenotypic and genotypic variation of this species have been studied in North America (L. M. King 1993; King and B. A. Schaal 1990; J. C. Lyman and N. C. Ellstrand 1998; O. T. Solbrig 1971; R. J. Taylor 1987), but results of those studies did not lead to the recognition of microspecies.

Specimens of *Taraxacum officinale* with deeply lobed leaves are sometimes difficult to distinguish from those of *T. erythrospermum* when fruits are missing (see also R. J. Taylor 1987). Usually, however, early leaves of the former are much less deeply lobed than those of the latter, which are more consistently lacerate throughout development, though broadly winged initially. The two taxa are easily distinguished in fruit, the red cypselae of *T. erythrospermum* standing out from the dull olive ones of *T. officinale*.

In northeastern North America, *Taraxacum officinale* and *T. lapponicum* often are confused, which has led to reports of the common dandelion farther north than I have been able to verify (it has yet to be collected from the Nunavik region of Quebec, for instance). The characters in the key above help separate the two taxa.

The typification by A. J. Richards (1985) would leave the common dandelion of both Europe and North America without a valid name (J. Kirschner and J. ?tepánek 1987). For the time being, with the nomenclatural situation still not resolved, I am following traditional usage of the name *Taraxacum officinale*.

Taraxacum scopulorum (A. Gray) Rydb. [FNA19, HC2]

Mem. New York Bot. Gard. 1: 455. 1900.
alpine dandelion

Taraxacum lyratum (Ledeb.) DC. [HC], misapplied

First collected in WA in Whatcom County in 1934. Determination confirmed in 2019.

Tetradymia [FNA20, HC, HC2]

Prodr. 6: 440. 1838.
horse-brush

***Tetradymia canescens* DC. [FNA20, HC, HC2]**

Prodr. 6: 440. 1838.
gray horsebrush, spineless horsebrush
Tetradymia inermis Nutt.

***Tonestus* [FNA20, HC2]**

Bot. Gaz. 37: 262. 1904.
serpentweed

***Tonestus lyallii* (A. Gray) A. Nelson [FNA20, HC2]**

Bot. Gaz. 37: 262. 1904.
Lyll's goldenweed, Lyall's serpentweed
Haplopappus lyallii A. Gray [HC]

FNA20: "*Tonestus lyallii* is widespread in the central Rocky Mountains and ranges of the Pacific Northwest, and is known in the Great Basin from collections in the Ruby Mountains in Elko County, Nevada. Populations documented from the Coast Range in Siskiyou and Trinity counties, California, are disjunct from those in Oregon and Washington by more than 700 km."

***Townsendia* [FNA20, HC, HC2]**

Fl. Bor.-Amer. 2: 16, plate 119. 1834.
townsend daisy, townsendia

***Townsendia florifera* (Hook.) A. Gray**

Proc. Amer. Acad. Arts xvi. 84. 1880.
showy Townsend daisy, showy townsendia

Townsendia florifer (Hook.) A. Gray
Townsendia florifer (Hook.) A. Gray var. *florifer*
Townsendia florifera (Hook.) A. Gray var. *watsonii* (A. Gray) Cronquist

***Tragopogon* [FNA19, HC, HC2]**

Sp. Pl. 2: 789. 1753; Gen. Pl. ed. 5, 346. 1754.
goatsbeard, salsify

****Tragopogon dubius* Scop. [FNA19, HC, HC2]**

Fl. Carniol. ed. 2: 2: 95. 1772.
yellow salsify

FNA19: "*Tragopogon dubius*,/i> is naturalized across much of North America. It typically grows in sites drier than those where *T. pratensis* is found."

****Tragopogon floccosus* Waldst. & Kit. [HC2]**

Descriptiones et Icones Plantarum Rariorum Hungariae 2: 116, t. 112. 1861.
woolly goatsbeard

***Tragopogon mirus* Ownbey [FNA19, HC, HC2]**

Amer. J. Bot. 37: 497. 1950.
remarkable goatsbeard

FNA19: "*Tragopogon mirus* is allotetraploid, formed from *T. dubius* and *T. porrifolius*. It originated (probably repeatedly) in the United States (eastern Washington, adjacent Idaho, and near Flagstaff, Arizona). F1 hybrids between *T. dubius* and *T. porrifolius* resemble *T. mirus* but are less robust, have low pollen stainability, and set few, if any, seeds. *Tragopogon mirus* does not occur in Europe, but *T. dubius* and *T. porrifolius* may occasionally hybridize there when sympatric."

***Tragopogon miscellus* Ownbey [FNA19, HC, HC2]**

Amer. J. Bot. 37: 498. 1950.
hybrid goatsbeard

FNA19: "*Tragopogon mirus* is allotetraploid, formed from *T. dubius* and *T. porrifolius*. It originated (probably repeatedly) in the United States (eastern Washington, adjacent Idaho, and near Flagstaff, Arizona). F1 hybrids between *T. dubius* and *T. porrifolius* resemble *T. mirus* but are less robust, have low pollen stainability, and set few, if any, seeds. *Tragopogon mirus* does not occur in Europe, but *T. dubius*

and *T. porrifolius* may occasionally hybridize there when sympatric."

**Tragopogon porrifolius* L. [FNA19, HC, HC2]

Sp. Pl. 2: 789. 1753.

oyster plant, purple salsify

FNA19: "*Tragopogon porrifolius* is occasionally cultivated in Europe and naturalized across much of North America. It grows typically in sites drier than those of *T. pratensis* and in sites shadier and/or moister than those of *T. dubius*. As currently circumscribed, it may not be monophyletic, and nomenclatural changes for the populations here may be required. In North America, *T. porrifolius* hybridizes with both *T. dubius* and *T. pratensis* (= *T. xneohybridus* Farwell, described from North America, and *T. xmirabilis* Rouy, described from Europe)."

**Tragopogon pratensis* L. [FNA19, HC, HC2]

Sp. Pl. 2: 789. 1753.

Jack-go-to-bed-at-noon, meadow salsify

Tragopogon pratensis L. ssp. *pratensis*

FNA19: "*Tragopogon pratensis* is naturalized across much of North America. The circumscription and infraspecific taxonomy of *T. pratensis* in Europe are debated, and the name *T. pratensis* may prove to be inaccurately assigned to the introduced populations in North America." ssp. taxonomy needs more study, using key in Stace (1997)

**Tripleurospermum* [FNA19, HC2]

Tanacetum. 31. 1844.

mayweed

**Tripleurospermum inodorum* (L.) Sch. Bip. [FNA19, HC2]

Tanacetum. 32. 1844.

false chamomile, false mayweed, scentless mayweed

Matricaria inodora L. [HC]

Matricaria maritima L. ssp. *inodora* (L.) Soó

Matricaria perforata Mérat

Tripleurospermum maritimum (L.) W.D.J. Koch ssp. *inodorum* (L.) Applequist

Tripleurospermum perforatum (Mérat) M. Lainz

FNA19: "*Tripleurospermum inodorum* has been classified as a noxious weed (class C) in the state of Washington and is considered invasive in other states (it is resistant to some herbicides); it is a weed of cereals in western Canada. W. L. Applequist (2002) has shown that the name *Matricaria inodora* is not a superfluous new name for *M. chamomilla* as earlier stated by S. Rauschert (1974). Therefore, the appropriate name under *Tripleurospermum* is *T. inodorum*. She also considered its type to belong in *T. maritimum* and formally recognized it there as subsp. *inodorum*, on the basis of hybridization with other *T. maritimum* subspecies (A. Vaarama 1953); on the same basis, however, Hämet-Ahti maintained the species distinction between *T. inodorum* and *T. maritimum*, while making *T. phaeocephalum* a subspecies of the latter. Q. O. N. Kay (1994), in a more extensive review of the literature and of hybridization data, also maintained *T. inodorum* and *T. maritimum* as distinct species, a conclusion followed here. From the standpoint of weed science, taxonomic merging of *T. inodorum* and *T. maritimum* has the inconvenience of grouping under a single specific name taxa that have different physiologies, ecologies, weed potentials, and, possibly, reactions to weed control measures. The name *Matricaria inodora* var. *agrestis* Weiss was not validly published."

**Tussilago* [FNA20, HC, HC2]

Sp. Pl. 2: 865. 1753; Gen. Pl. ed. 5, 372. 1754.

coltsfoot

**Tussilago farfara* L. [FNA20, HC, HC2]

Sp. Pl. 2: 865. 1753.

coltsfoot, tussilago

FNA20: "Flowering heads of *Tussilago farfara* close at night (laminae of ray corollas arch and roll inward). The species is becoming an invasive weed in some areas."

Uropappus [FNA19, HC2]

Trans. Amer. Philos. Soc., n. s. 7: 424. 1841.
silverpuffs

Uropappus lindleyi (DC.) Nutt. [FNA19, HC2]

Trans. Amer. Philos. Soc., n. s. 7: 425. 1841.
Lindley's false silverpuffs

Microseris lindleyi (DC.) A. Gray [HC]

Microseris linearifolia (Nutt.) Schultz Bipontinus

Uropappus linearifolius Nutt.

FNA19: "Uropappus lindleyi was placed in *Microseris* (K. L. Chambers 1955) because of two allotetraploid species formed by hybridization with annual members of that genus. A number of morphologic features, including narrow, acuminate leaves with villous-ciliate margins, erect heads, relatively long outer phyllaries, cypselae often short-beaked, and pappi of white, lustrous scales suggest a connection with *Nothocalais*, especially *N. troximoides*. Phylogenetic studies of chloroplast DNA variation (R. K. Jansen et al. 1991b; J. Whitton et al. 1995) link *Uropappus* with *Nothocalais* and *Agoseris* as a sister clade to *Microseris*. Consequently, Jansen et al. separated *Uropappus* from *Microseris* and placed the two allotetraploid species in *Stebbinsoseris*."

Wyethia [FNA21, HC, HC2]

J. Acad. Nat. Sci. Philadelphia. 7: 39, plate 5. 1834.
mule's-ears, wyethia

Wyethia amplexicaulis (Nutt.) Nutt. [FNA21, HC, HC2]

Trans. Amer. Philos. Soc., n. s. 7: 352. 1840.
northern mule's ears, smooth dwarf sunflower

Wyethia angustifolia (DC.) Nutt. [FNA21, HC, HC2]

Trans. Amer. Philos. Soc., n. s. 7: 352. 1840.
narrowleaf mule's ears, narrowleaf wyethia

Alarconia angustifolia DC.

Wyethia angustifolia (DC.) Nutt. var. *angustifolia*

Wyethia angustifolia (DC.) Nutt. var. *foliosa* (Congdon) H.M. Hall

Xanthium [FNA21, HC, HC2]

Sp. Pl. 2: 987. 1753; Gen. Pl. ed. 5, 424. 1754.
cocklebur

Xanthium orientale L. [WTU]

cocklebur, common cocklebur

Xanthium strumarium L.

Xanthium strumarium L. var. *canadense* (Mill.) Torr. & A. Gray

Xanthium strumarium L. var. *glabratum* (DC.) Cronquist

Xanthium strumarium L. var. *oviforme* (Wallr.) M. Peck

Xanthium strumarium L. var. *pensylvanicum* (Wallr.) M. Peck

Xanthium strumarium L. var. *strumarium*

Xanthium strumarium L. var. *wootonii* (Cockerell) W.C. Martin & C.R. Hutchins, invalidly published

Xanthium strumarium is a misapplied name referential to plants occurring in Eurasia, southeast Asia, and northern Africa. It is not known from North America..

***Xanthium spinosum** L. [FNA21, HC, HC2]

Sp. Pl. 2: 987. 1753.
spiny clotbur, spiny cocklebur

Xanthium ambrosioides Hook. & Arn.

Xanthium spinosum L. var. *inerme* Bel

FNA21: "Some authors have contended that *Xanthium spinosum* originated in South America and is introduced and/or naturalized everywhere else that it is found." Considered native to California in Jepson Manual (1993).

Compositae: see Asteraceae
